

Network Intrusion Detection System using Snort

1. Introduction

A Network Intrusion Detection System (NIDS) is a cybersecurity tool used to monitor network traffic and detect suspicious or malicious activities. It helps security professionals identify potential threats, attacks, and unauthorized access attempts in a network environment.

This project focuses on implementing a Network Intrusion Detection System using Snort in Kali Linux to monitor network traffic and generate alerts for suspicious activity.

2. Objective

The main objective of this project is:

- To understand the basics of intrusion detection systems
- To install and configure Snort
- To monitor network traffic in real time
- To create custom alert rules
- To detect suspicious network activities

3. Tools and Technologies Used

- Snort
- Kali Linux Operating System
- Terminal / Command Line Interface
- Network Monitoring Tools

```
64 bytes from 8.8.8.8: icmp_seq=17 ttl=255 time=158 ms
64 bytes from 8.8.8.8: icmp_seq=18 ttl=255 time=92.4 ms
64 bytes from 8.8.8.8: icmp_seq=19 ttl=255 time=95.4 ms
64 bytes from 8.8.8.8: icmp_seq=20 ttl=255 time=141 ms
^C
--- 8.8.8.8 ping statistics ---
20 packets transmitted, 20 received, 0% packet loss, time 19200ms
rtt min/avg/max/mdev = 53.064/96.149/158.372/27.740 ms
```

```
black@black-VirtualBox:~$
```

```
black@black-VirtualBox:~$ snort -V
```

```

  ,,_  -*> Snort! <*-
o"  )~ Version 2.9.20 GRE (Build 82)

      Using libpcap version 1.10.4 (with TPACKET_V3)
      Using PCRE version: 8.39 2016-06-14
      Using ZLIB version: 1.3
```

```
black@black-VirtualBox:~$
```

4. Snort Installation

Snort was installed in Kali Linux using the package manager.

Installation Command

```
sudo apt update
```

```
sudo apt install snort -y
```

Version Check

```
snort -V
```

The successful installation was verified by checking the Snort version.

5. Network Configuration

The available network interfaces were identified using the following command:

```
ip a
```

The network interface was selected for monitoring network traffic.

Example interfaces:

- wlan0
- eth0

6. Snort Configuration and Monitoring

Snort was configured to monitor network traffic using the following command:

```
sudo snort -A console -i wlan0 -c /etc/snort/snort.conf
```

This enabled Snort to analyze network packets in real time.

7. Custom Rule Creation

A custom rule was created to detect ICMP ping traffic.

Rule Used

```
alert icmp any any -> any any (msg:"ICMP Ping Detected"; sid:1000001;)
```

This rule generates an alert whenever ping traffic is detected in the network

The screenshot shows a terminal window titled 'black@black-VirtualBox: ~'. The nano 7.2 editor is open, editing the file '/etc/snort/rules/local.rules'. The content of the file is as follows:

```
GNU nano 7.2 /etc/snort/rules/local.rules
alert icmp any any -> $HOME_NET any (msg:"ICMP Ping Detected"; sid:1000001; rev:1;)
# $Id: local.rules,v 1.11 2004/07/23 20:15:44 bmc Exp $
# -----
# LOCAL RULES
# -----
# This file intentionally does not come with signatures.  Put your local
# additions here.
```

The bottom of the terminal shows the nano editor's status bar with various keyboard shortcuts: ^G Help, ^O Write Out, ^W Where Is, ^K Cut, ^T Execute, ^C Location, M-U Undo, M-A Set Mark, ^X Exit, ^R Read File, ^\ Replace, ^U Paste, ^J Justify, ^_ Go To Line, M-E Redo, M-6 Copy. A small box above the status bar indicates '[Read 7 lines]'.

8. Traffic Generation and Alert Detection

To test the intrusion detection system, network traffic was generated using the ping command.

Traffic Generation Command

```
ping 8.8.8.8
```

Snort successfully detected ICMP traffic and generated alerts in the terminal.

Example alert:

```
[**] ICMP Ping Detected [**]
```

This confirmed that the Network Intrusion Detection System was functioning correctly.

9. Output

The Snort intrusion detection system successfully monitored network traffic and generated alerts based on the custom detection rule.

The project demonstrated the ability of Snort to identify suspicious traffic and improve network monitoring

A screenshot of a terminal window titled 'black@black-VirtualBox: ~'. The terminal displays a series of 20 lines of Snort alerts. Each line contains a timestamp, a priority level, a rule ID, a rule name, and a detailed alert message. The alerts are for ICMP ping activity detected between 192.168.52.3 and 8.8.8.8. The terminal has a dark background with light-colored text. The window includes standard Linux window controls (minimize, maximize, close) and a search icon in the top right corner.

06/02-14:09:04.941253 06/02-14:09:05.003555 06/02-14:09:05.942584 06/02-14:09:06.059063 06/02-14:09:06.945169 06/02-14:09:07.077779 06/02-14:09:07.958734 06/02-14:09:08.022946 06/02-14:09:08.985702 06/02-14:09:09.060337 06/02-14:09:10.101781 06/02-14:09:10.174039 06/02-14:09:11.103427 06/02-14:09:11.196242 06/02-14:09:12.105876 06/02-14:09:12.232284 06/02-14:09:13.106691 06/02-14:09:13.172539 06/02-14:09:14.109351 06/02-14:09:14.218971 06/02-14:09:15.111050 06/02-14:09:15.269385 06/02-14:09:16.111973 06/02-14:09:16.204332 06/02-14:09:17.113986 06/02-14:09:17.209378 06/02-14:09:18.132085 06/02-14:09:18.273515
```

10. Learning Outcome

Through this project, I learned:

- Basics of Network Intrusion Detection Systems (NIDS)
- Snort installation and configuration
- Real-time network traffic monitoring
- Custom rule creation in Snort
- Network security and threat detection

11. Conclusion

This project provided practical experience in implementing a Network Intrusion Detection System using Snort. By monitoring network traffic and detecting ICMP ping activity, the project demonstrated how intrusion detection systems help improve cybersecurity and network security.

The implementation of Snort helped in understanding network monitoring techniques and threat detection mechanisms in a real-world environment.
